Subject: Solar FiT Review

Dept of State Growth,

Submission – 11th July 2018

The Feed in Tarriff for Solar roof top power generation needs to mutually beneficial,

a) customers send excess power to grid for use by community, which in turn reduces the energy quantum required to be produced from fossil fuels and or renewables),

b) customers in turn, receives 100% feed in tariff against electricity charges (meaning dollar for dollar offset against electricity charges), over a 24 hour period, not just the 12 hour period currently. This would address the current price gouging by the energy companies and be fairer to the customers who took the initiative and cost to install roof top solar systems.

Regards,

William Clarke.
